

1 and gives you what it sees. Now, alpha-numeric data and  
2 digital display data are exclusive types of transmissions or  
3 exclusive formats of data so the Hark verifier has incorrectly  
4 interpreted alpha as alpha and has given us a code that  
5 doesn't really make much sense because it was an alpha  
6 traffic. Didn't correctly interpret it, let me rephrase that,  
7 it wrote down what it seen and what it seen was on the 152.51  
8 channel WAWEAJJJ, and on the 251.48 channel is also recognized  
9 WAWEAJJJ. The numeric message content of the two pages on  
10 251.51, the numeric message was 7367791, and the numeric  
11 message on the 152.48 channel was 7367791. The time of the --  
12 time and date of the page from the 152.51 channel was 10/28/92  
13 at 4:30.54, 1630 and 54 seconds, the message from 152.48 was  
14 10/28/92 at 1631 and 35 seconds, slightly after that. So, it  
15 would be unreasonable to assume that someone else generated a  
16 page to this cap code with this message content at random and  
17 had them show up on two different channels at the same time,  
18 virtually within minutes of each other, to the same cap code,  
19 with the same message accidentally or unintentionally. Now,  
20 the second page -- the second -- shall read another one?

21 Q Sure, go ahead and give me another one.

22 A The second one, the cap code was 0008027 on both,  
23 address 3, identical, but the, the alpha message is identical,  
24 V5T0 at JJJ, V5T0 at JJJ, the numeric message was 6754340 in  
25 both cases, same day, same minute, virtually one minute or two

1 apart. So, as we look down through here we seen that the  
2 correlation that we identified was that every 152.48 page,  
3 virtually, and I'm not -- maybe not every one, but virtually  
4 every one of the 152.48 pages that we found were also in  
5 152.51. And in my opinion, there's only one place that could  
6 have occurred, at the Capitol terminal location and in my  
7 opinion it was intentional.

8 Q Is there a standard protocol for operating this Hark  
9 verifier?

10 A There is a standard setup procedure, yes.

11 Q Does the manufacturer give you an instruction manual  
12 or something?

13 A Yes, they do.

14 Q Did you follow the instruction manual when you're  
15 doing this testing?

16 A Yes, we did.

17 Q Did you modify the equipment in some way other than  
18 the, the way the manufacturer makes it?

19 A I -- no, I didn't.

20 Q Did you use the Hark verifier back in 1990 when you  
21 had that other interference problem?

22 A No. Unfortunately, digital paging in 1990 was a  
23 rapidly growing business and there -- we didn't know the way  
24 to actually decode the messages that were going out on the  
25 air. Hark came out with the verifier in March of '91 and we

1 promptly got a demo unit in and tried it out and liked it.  
2 There's no doubt that it's, it's a very reliable and  
3 indispensable tool that any paging company needs to have to,  
4 to, to verify that the page went out over the air. When  
5 you're serving the medical community, legal community, law  
6 enforcement, you -- as the carrier you, you have to be  
7 confident that when a message is generated it was sent. Now,  
8 the caveat to that is that, again, paging just is not -- any  
9 kind of rf is just not 100-percent reliable. If you walk in a  
10 multi-path area or get a little multi-path fading you might  
11 miss a digit or two in your display. You might -- just as  
12 driving down the road in your, in your car tune to an FM  
13 station and hear a "ffttt," a little piece of static there,  
14 that's going to happen. And when you're transmitting data  
15 during that little phaseout period, the data is not going to  
16 be intelligible by the receiver. So, as the carrier, the only  
17 way that you can verify that you did your job as the carrier  
18 is to make sure that the page went out over the air and that's  
19 what the Hark verifier does for you. It doesn't guarantee  
20 that the page was ever received by anyone. It only proves  
21 that the carrier did its best job in delivering the page to  
22 the, to the air.

23 Q And, and this terrific gizmo simply didn't exist  
24 back in the, the fall of 1990?

25 A I didn't see it any. And as soon as we found out

1 that Hark manufactured one, Hark is the manufacturer, it's  
2 called the Verifier, so that's why we call it the Hark  
3 verifier, came out with that in March of 1991. And at a trade  
4 show shortly after that we, we got right on it and, and got  
5 one and it tried it out and, and it was, it was so phenomenal  
6 that we now have two of them.

7 Q So, you'd been using it for a little while before  
8 you actually tested -- used the thing for this particular  
9 interference problem?

10 A We had some experience with it. I don't recall  
11 exactly when we took delivery of the, the two -- the second  
12 unit, but we had, we had experience with it, yes.

13 Q You had mentioned doctors, ambulances, police  
14 officials, etc. Are these actual RAM customers you're  
15 referring to?

16 A Yes.

17 Q Service to doctors and ambulances?

18 A Yes.

19 Q Were these customers during these periods of  
20 interference?

21 A Oh, yes.

22 COURT REPORTER: Could you speak up, please?

23 MR. BOBBITT: Yes, I'm sorry. Yes, they were.

24 BY MR. JOYCE:

25 Q So, it's possible that the interference would have

1 caused pages to ambulance services and doctors not to go out?

2       A     It's possible, and it, it occurred -- happened that  
3 way. As -- RAM Technologies also owns an answering service  
4 that again caters heavily to the, the medical community and  
5 they are the first ones to hear a complaint when they generate  
6 a page and the doctor doesn't receive it, and we receive  
7 numerous complaints as to that problem.

8       Q     Weren't you also providing service to sheriffs or  
9 some kind of police officials?

10       A     Yes. Drug-enforcement agencies, sheriffs, local  
11 police departments.

12       Q     So, the same thing I presume, the interference  
13 problem could have affected their service as well?

14       A     Could have and did, yes.

15       Q     Were you aware of any efforts by Capitol to work  
16 with RAM to try to eliminate this interference?

17       A     Yes, yes.

18       Q     What were those efforts?

19       A     In the later stages -- the, the early stages we  
20 found were, were not very cooperative. In the later stages, I  
21 don't know what prompted the response, but we did, we did see  
22 busy monitors go on the air. We had, we had offered to build  
23 or to jointly build a wire line control to make that a little  
24 bit more reliable than rf but Capitol declined to do that.  
25 So, in the later stages there, there was cooperation, yes.

1 Q What approximate time frame would you say that was?

2 A I don't remember.

3 Q Was it before or after the, the time period when you  
4 did the Hark verifier reports?

5 A Before.

6 Q So, the interference occurred even after they were  
7 busy monitoring?

8 A Oh, yes, yes. In, in my opinion -- and, and what  
9 seems obvious to me is that the interference just continued to  
10 take a more sophisticated nature. Whereas, the early stages  
11 we had interference which was very easily identified as  
12 broadcast band radio traffic on the control link. I don't  
13 know where it came from, but it was very easy to, to, to say  
14 somebody is keying a transmitter on our link frequency and  
15 holding up a microphone to a speaker. It was, it was very  
16 simple. The next level was simultaneous data or digital  
17 traffic that sounded stereo. A little bit harder to determine  
18 because it's digital so your can't pick out the message, you  
19 don't know where it came from necessarily, although the  
20 station I.D. told us appropriately where it came from. The  
21 next level which was what we heard was testing which was  
22 completely inappropriate to, to make sure that you're system  
23 is working, continuous testing of a pair or several pages, I  
24 don't know exactly how many it was, but pagers, but for hours  
25 and hours on end these test pages going out of the air which

1 might have been a loophole, you know, well, we're testing the  
2 system, I don't know. So, and then finally, true digital  
3 traffic that needs to have some other level of technology to  
4 determine what it is. So, it's, it's been -- yes, there was  
5 interference both before and after, but it just continued to  
6 get more complicated to track and identify.

7 Q Would it have been possible for Capitol to override  
8 this busy monitor?

9 A Oh, Yeah. Turn it off.

10 Q Where, where typically is this busy monitor located?

11 A Physically, the receiver needs to be under the  
12 umbrella of the co-channeler's transmitter. So, in other  
13 words, if, if, if I need to monitor a city that's too far away  
14 to hear from where I'm standing, in other words, where my  
15 terminal is, I need to put a receiver up there under the  
16 umbrella of the, of the transmitter, feed that signal back to  
17 the, to the terminal so that the terminal can effectively hear  
18 the local signal and know when to transmit and when not to  
19 transmit.

20 Q So, you're, you're calling a busy monitor or  
21 receiver, that's presumably the technical --

22 A A busy monitor is basically a receiver that's tuned  
23 to the channel that you're not supposed to be transmitting on  
24 while that receiver is receiving a signal. So, it's an  
25 exclusive -- logically, it's an exclusive gate there. We're

1 going to listen to the channel, if it's idle we'll transmit,  
2 if it's busy we won't. And that's why we call it a busy  
3 monitor. It's really just a receiver listening to the channel  
4 and the squelch is the receiver is what we're looking at so  
5 that when there's something on the air the squelch opens up  
6 and we say oops, there's something on the air. When, when  
7 something is not, the squelch will close down, silencing the  
8 receiver, closing the relay that says it's busy or not and  
9 that's the signal that we look at.

10 Q But that happens automatically. You say we, you're  
11 referring to the equipment I presume.

12 A Yeah, yeah, the -- that's right, it's very  
13 automatic.

14 Q It's -- it does that automatically? It's attached  
15 to the transmitter so that --

16 A No, it's, it's close to the transmitter in the same  
17 city, the same umbrella of coverage. And the signals from it  
18 -- whether they're local to the terminal or remove from the  
19 terminal, those control signals need to be relayed back to the  
20 terminal so that the terminal can respond.

21 Q I see. So, the busy monitor could have been in, in  
22 Capitol's office or it could have been in a shack near the  
23 transmitter? There are a couple of different places it could  
24 have been?

25 A Capitol's busy monitor?

1 Q Yes.

2 A Yes, could have been. As long as it can hear RAM's  
3 transmitter.

4 Q It wouldn't have been able to monitor outside of the  
5 Charleston/Huntington areas where their transmitters aren't  
6 located unless they happened to put one further away? Just so  
7 I understand.

8 A That's right. They wouldn't be able to listen to  
9 Lexington, simply because they can't hear the Lexington signal  
10 from Charleston. Had they desired to, they would have had to  
11 put a receiver in Lexington and transfer -- or transport that  
12 signal back to that -- the control signals back to the  
13 terminal.

14 Q But that, that is a fairly common way of sharing  
15 these frequencies to avoid co-channel interference to have  
16 this busy monitor?

17 A That's a common way, and so is wire line control.  
18 Where you do away with the receivers entirely and the  
19 propensity for a receiver to accidentally open squelch or to  
20 hear an interfering signal and false -- you do away with that  
21 entirely and purchase a telephone line basically, a telco  
22 circuit, that we connect our terminal -- or terminal A to  
23 terminal B. So that there's no doubt when the circuit is up  
24 on the -- when the circuit is reliable, terminal A says I'm  
25 busy, terminal B sees that, there's no question, and vice

1 versa.

2 Q And that was the proposal you referred to earlier  
3 that, that RAM made to, to Capitol?

4 A Yes, yes, we did.

5 Q And it's called -- I've heard a different  
6 expressions for this. They call it tieing the terminals  
7 together? Is that one way they --

8 A That's one way. Wire line monitor, exclusive busy  
9 circuit. There, there are several terms you might use. But  
10 the effect is that we see a physical or an electrical  
11 connection at my terminal or terminal A that is sent from  
12 terminal B. Not via the airwaves, not via secondary  
13 receivers. It's a physical circuit much like a tie line, and  
14 that's exactly what it is, a tie line.

15 Q And a tie line being for, for me, a telephone line I  
16 presume?

17 A Telephone line. If you were in an office, in an  
18 office and, and you had an office remote and you could tie the  
19 two together, pick up, pick up line 1 if it was the tie line,  
20 a busy light would go on to all the other phones and all the  
21 other phones would know that line is busy. You would talk to  
22 the other line, they would pick up the line, talk to you.  
23 It's a, it's a dedicated, 24-hour-a-day, 365-day-a-year  
24 circuit purchased from the telco or provided locally and that  
25 connects the two terminals together and provides a, a tie line

1 E&M type signaling function that is -- that's, you know, very  
2 reliable.

3 Q And you're saying that would have been more reliable  
4 than both Capitol and RAM using this off air monitoring  
5 receiver?

6 A Yes, it would be more reliable. And it costs mores.

7 Q What would the approximate cost be?

8 A Well, the cost is purely distance-sensitive, so it  
9 could range anywhere from \$100 a month to \$500 a month. In  
10 our case, I think we checked -- we looked into it, it was  
11 around \$300 a month to connect the Charleston Capitol terminal  
12 and the Ashland RAM terminal together.

13 Q And you -- that's a total cost? You had offered to  
14 split that cost with Capitol? Is that correct?

15 A Yes, we did.

16 Q So, it would have been 150 per month for you and 150  
17 for them?

18 A That's right. And RAM is an interexchanged carrier  
19 as Capitol well know, we, we could have done that very easily.  
20 Capitol was at one time a customer of ours, purchasing DID  
21 service on that same network that we had proposed to tie the,  
22 the two systems together with.

23 Q Would that have eliminated any interference problems  
24 between your two systems?

25 A That would have eliminated any busy monitor

1 problems. That doesn't say that there wouldn't have been  
2 other chaining type interference schemes thought of that might  
3 still create just as, just as bad of interference. But we  
4 couldn't have related it to poor busy monitor design.

5 Q So, it's fair to say it would have eliminated  
6 unintentional interference problems?

7 A Well, it would have been a much more reliable way of  
8 making sure that only one transmitter system was on the air at  
9 a time.

10 Q Okay. I understand. You're, you're having trouble  
11 with my saying -- there are various --

12 A There's various ways you can interfere with, with  
13 someone if you want to. The busy monitor only prevents the  
14 two transmitter systems from going on the air at one time.

15 Q And again, just so -- I'm going to get off this busy  
16 monitor real soon. But the, the device itself, it's only good  
17 if the thing is turned on?

18 A Of course.

19 Q And there's, there's just a switch or something you  
20 can just flip the thing off and --

21 A That's right. It's only good if it was -- if it's  
22 used as it's intended. I -- we can disconnect the antenna  
23 from it, turn the power off, disconnect the connection to the  
24 terminal. It's, it's not a fail-safe unit. Just as, you  
25 know, your car is only good with four wheels on it. Take out

1 off and it's not going to run well.

2 Q Can you tell -- when, when RAM's operating on  
3 152.48, is there some way for you to tell if somebody is not  
4 busy monitoring?

5 A Yes.

6 Q And how would you tell?

7 A Well, because our busy monitor circuit not only  
8 relays the fact that a channel is on the air or off the air in  
9 a remote city, it also relays the audio itself. Then we, we  
10 would have the ability to listen to that remote city. We  
11 listen to the remote city and if it sounds like two  
12 transmitters are on the air at one time and we look at our  
13 control system that says we are on the air, well, then we know  
14 that there is someone else who's on the air that shouldn't be.  
15 Or that -- well --

16 Q So, were, were there times when you were able to  
17 determine that Capitol was not busy monitoring?

18 A Yes.

19 Q Were there just a few times, or how many times?

20 A Well, of course, in the course of these three or  
21 four year's worth of this there were several times.  
22 Particularly in the early days for several periods of time.  
23 And the easiest way to determine that is that while, while  
24 RAM's in the middle of a batch of traffic, all of a sudden  
25 right in the middle of the batch of traffic, poof, comes a

1 station I.D. for another transmitter or some other data on top  
2 of the channel and then goes away. Well, you know that person  
3 was not listening to the channel. And that happened dozens of  
4 times in the early-1990 and '91 period.

5 Q And the station I.D. you associated with Capitol's  
6 station I.D.?

7 A Yes.

8 MR. JOYCE: I have no further questions.

9 JUDGE CHACHKIN: We'll take our lunch and recess  
10 until 1:45.

11 (Whereupon, a recess was taken for lunch from 12:39  
12 p.m. until 1:45 p.m..

1 A F T E R N O O N S E S S I O N

2 JUDGE CHACHKIN: Back on the record. Mr. Hardman?

3 MR. HARDMAN: Thank you, Your Honor.

4 CROSS-EXAMINATION

5 BY MR. HARDMAN:

6 Q Mr. Bobbitt, at one point shortly before the break  
7 you were talking about the -- RAM's customer base on its  
8 private carrier paging system in the Charleston/Ashland area  
9 and I believe you said, did you not, that the customer base --  
10 significantly since you started in '89. Is that right?

11 A Yes.

12 Q And can you translate the customer growth into  
13 channel occupancy time on 152.48, at least in general terms  
14 over the period of time from let's say fall 1990 when you were  
15 -- when you testified you first experienced the interference  
16 until -- well, let's say until the fall of last year, '93?

17 A Specifically?

18 Q I'd, I'd like to get some idea of, of how the growth  
19 in your customer base translated into the increased use of  
20 152.48 by RAM's system.

21 A As more customers were put on it, it got busier.

22 Q And --

23 A And as we, as we expanded our -- got busier also.

24 Q Okay, and out of an hour let's say, about how much  
25 time would be paging by transmission to RAM's pages?

1 A At what point in time?

2 Q Well, let's -- are there peaks and valleys?

3 A Well, I really don't recall traffic statistics  
4 verbatim, but the traffic went from not busy to very busy.

5 Q Well --

6 A Ten minutes an hour or twenty minutes an hour to  
7 forty, fifty minutes an hour.

8 Q Okay. What I'm trying to establish is the, the  
9 trend over a period of time. Now, let's, let's first talk  
10 about the character of the paging traffic. Is it your  
11 testimony that how busy the channel is with RAM traffic  
12 depends upon what time of day you're talking about?

13 A Yes.

14 Q Would it also depend on --

15 A It wasn't my testimony. I don't think I said that.  
16 But that's a true statement.

17 Q All right --

18 A Traffic varies by time.

19 Q Okay, and would it be -- would it also be true that  
20 some days are busier than other days?

21 A Yes. I'd agree with --

22 Q Now, do you have a rule of thumb that you use in  
23 your, your business about which are the busiest times for  
24 paging traffic?

25 A No. There are some, some historical statistics you

1 could probably draw upon. But rule of thumb I don't --

2 Q Well, what information do you use as part of your  
3 duties as the technical manager for RAM to determine when the,  
4 the peak demand is for your paging traffic?

5 A Well, first off, from the rf point of view, we  
6 don't. From the telephony point of view, we use a statistic  
7 of all trunks busy and try to reduce that down to zero.

8 Q All right. So, you try to have as many trunks as  
9 necessary that no one has to get a busy signal?

10 A That's --

11 Q Is that what you mean when you dial --

12 A Well, as close as possible without, without being  
13 sloppy.

14 Q All right, and about how many telephone trunks does  
15 that require at this point?

16 A I don't know if I should say or not. I, I really  
17 don't think it's your business, personally. I'd be glad to  
18 say so if you --

19 MR. JOYCE: Your Honor, it -- Your Honor, that's a  
20 fair point. Mr. Hardman and I believe have consented to a  
21 confidentiality agreement. These are obviously paging  
22 competitors. Information -- current information about the  
23 number of customers on RAM's system, number of telephone lines  
24 that they need. Some of this information would be considered  
25 decidedly confidential by -- so I, I would object on the basis

1 of, of confidentiality.

2 JUDGE CHACHKIN: Well, the witness has already  
3 indicated the thousands. Seems to me -- of customers they  
4 have -- I don't know by telling the number of trunks is  
5 particularly confidential.

6 MR. JOYCE: Well, the, the witness has indicated  
7 that it, it is and I have no independent reason for, for  
8 denying his assertion that that's -- losing confidential  
9 business information.

10 JUDGE CHACHKIN: You also reveal that they now have  
11 generated up to 50 minutes of traffic an hour. That also I  
12 assume would be confidential but that's been divulged in the  
13 record. I'm going to permit -- I'm not going to require any  
14 confidentiality. You can answer the question.

15 MR. BOBBITT: Yes, sir. Which city would you like?

16 BY MR. HARDMAN:

17 Q Well, we're talking about the terminal in Ashland at  
18 this point.

19 A The terminal in Ashland has, has five trunk groups  
20 in it.

21 Q Five trunk groups. Each group has more than one  
22 trunk?

23 A Yes.

24 Q And how many trunks total would that make?

25 A Total there are in Ashland 19 trunks I believe.

1           Q     All right. So, that means does it not that, that 19  
2 different pages -- customers could be placing 19 different  
3 pages at the same time on your system without incurring a busy  
4 signal when they dial in to do so. Is that right?

5           A     It means that customers -- 19 different customers  
6 can call in to the terminal simultaneously.

7           Q     Well, do they call in for reasons other than placing  
8 a page?

9           A     The pages go out one at a time.

10          Q     I understand that, and I will get to that.

11          A     Yeah.

12          Q     It might move a little faster if you answered the  
13 question and let me ask the questions, all right? Now, is it  
14 not true that under the engineering of the RAM's network at  
15 this point, 19 different customers could be calling in at the  
16 same time to place a page?

17          A     Yes.

18          Q     Now, the terminal takes those request for pages does  
19 it not, as it processes them it orders them in a sequence,  
20 does it not, to transmit over the air?

21          A     Yes.

22          Q     And as you said a moment ago, it transmits a page  
23 one at a time?

24          A     That's true.

25          Q     All right.

1           A     On each channel, yes.

2           Q     Now, we're talking 152.48. Was -- did I understand  
3 your testimony correctly that the 19 trunks -- 152.48 or did I  
4 misunderstand that?

5           A     It's got nothing to do with the channel. Just 19  
6 trunks coming in to the terminal. The subscribers could be  
7 assigned to any channel that we have active, which we have two  
8 in that terminal.

9           Q     Okay. So, so you use a common trunk -- to, to  
10 access pages on -- pagers on both of the PCP and I gather an  
11 RCC frequency that RAM has in service? Is that right?

12          A     Yes.

13          Q     Now, the terminal then takes the traffic, the pages  
14 that have been requested by customers calling and divides them  
15 by frequency that they're going to go out on. Is that right?

16          A     Yes.

17          Q     Okay, and for each frequency then it batches the  
18 pages in a sequence and sends out a page one at a time in some  
19 sort of queue. Is that right?

20          A     Yes.

21          Q     Now, so it's true is it not that the -- at busy  
22 times the -- there may be some delay from the period of time a  
23 customer calls in to place a page until the time that it's  
24 actually transmitted over the air. Isn't that true?

25          A     Yes.

1           Q     And that period -- the amount of time that the, the  
2     -- of delay between the time the customer places the page and  
3     it actually goes out over the air can be simply because the  
4     system is very busy and there are a lot of customers in the  
5     queue. Isn't that true?

6           A     To some extent, yes.

7           Q     To some extent?

8           A     That's one of the factors.

9           Q     That's one of the factors. So, it's true is it not  
10    that if the system is very busy there will be a much longer  
11    queue of pages waiting to go out over the air than if the  
12    system is not busy. Isn't that right?

13          A     That's, that's a fair statement.

14          Q     All right, and if I understood your testimony  
15    correctly earlier, the amount of time that a customer has to  
16    wait before a page is actually transmitted is an important  
17    factor in its view of the quality of service it's getting.  
18    Isn't that true?

19          A     To many customers it is, yes.

20          Q     Right. So that if customers have to wait -- feel  
21    that they have to wait too long, they, they complain about  
22    this don't they?

23          A     Yes.

24          Q     So, the amount of waiting time on a -- any system,  
25    especially -- well, the amount of waiting time before a page

1 is actually transmitted could be a very important consider-  
2 ation from an engineering stand point in maintaining a high  
3 quality of service. Isn't that true?

4 A One of the factors, yes.

5 Q And, and wouldn't that be one of, one of your  
6 principal responsibilities in your present position? Isn't  
7 that true?

8 A Yes.

9 Q All right. Now, at peak times how long does the --  
10 does your system hold -- back up pages before transmitting  
11 them?

12 A I don't know.

13 Q Do you get reports on this?

14 A No.

15 Q You never pay any attention to it?

16 A Yeah, I pay attention but it's not a, it's not a  
17 factor that you can rely upon because a digital page -- a  
18 hundred digital pages may only take 10 seconds to go out.

19 Q Well, but by the same token, if the system is very  
20 busy it may, may wait four or five minutes.

21 A That's right, it may. So, it's a very, it's a very  
22 dynamic variable that's very hard to track because of the  
23 composition of the pages as they come in.

24 Q Right. So, if, if RAM's system all of a sudden  
25 started getting to the point where pages were taking four or

1 five minutes or ten minutes to go out, you, you wouldn't study  
2 that problem, you wouldn't monitor that circumstance with  
3 reports?

4 A Consistent -- if it was consistently a problem we  
5 would.

6 Q Well, but I, I --

7 A Yes.

8 Q -- think I asked you a moment ago if you did and you  
9 testified you didn't. Isn't that right?

10 A But if it was -- if marketing told me that there's a  
11 consistent problem with customers receiving their pages late  
12 then we would have to look into it. But there's very little  
13 you could do about it except the resource is a resource. The  
14 channel is a resource and the best that you can do is to make  
15 sure that customers who request pages have a place to park the  
16 page or to park the page and that the channel is available  
17 when it's our turn to transmit and, and do our best to  
18 transmit them out.

19 Q Does RAM service as voice pagers?

20 A Yes. Regrettably.

21 Q And how, how many digital -- well, let me, let me  
22 ask that. I assume it also transmits digital display pages as  
23 well.

24 A Yes.

25 Q Is that right? Now, how many digital display pages,

1 approximately, transmit in the time that it takes one voice  
2 page?

3 A It varies.

4 Q Give me a ball park.

5 A Could be a -- it could be a short -- it's -- I don't  
6 know.

7 Q We're talking about a voice page a digital display  
8 page.

9 A I don't know. There's, there's --

10 Q You don't have any idea?

11 A -- there's too many variables there to answer that  
12 question.

13 Q All right. Let's assume that we're talking about a  
14 pox sag 515 signaling format and a 12-second voice message  
15 with a two-tone sequential front porch on the voice page. Now  
16 --

17 A I, I just don't know. I mean, I don't --

18 Q You don't have any idea?

19 A I don't have those memorized, no.

20 Q Well, give me a ball park. Are we talking 10, are  
21 we talking 100?

22 A Somewhere in that range.

23 Q All right. So, you would agree with -- do you not  
24 that if you -- to the extent that you have a voice page on the  
25 system that the RAM customer, the amount of time that that

1 page takes in the queue and in channel time requires  
2 potentially 100 or perhaps even more customers to wait for  
3 their page.

4 A For 12 seconds?

5 Q For 12 seconds.

6 A Yes. Oh, yeah, yeah.

7 Q Right. Right. So, if you have bunch of voice  
8 paging on the channel, that would, would -- that would in fact  
9 be waiting time of the entire customer base?

10 A Yes, it would.

11 Q So, as you -- in your capacity as for want of a  
12 better term chief engineer for the system, you wouldn't get  
13 reports monitoring what your customer mix is so that you would  
14 have more efficient transmission times on the channel?

15 A I looked into that occasionally. But again, we're a  
16 market-driven company and marketing tells -- doesn't -- I  
17 don't dictate that marketing shut off the voice pages unless  
18 marketing says the channel's backed up too long, what can we  
19 do to stop it? We can migrate off voice, we can go to higher  
20 speed digital, from 515 to 1200. Various ways to, to, to --  
21 you know, to make the channel more efficient. I don't dictate  
22 to marketing what they can sell and not sell. It's the other  
23 way around.

24 Q Well, but wouldn't it follow that when marketing  
25 tells you there's a, there's a problem with customer
